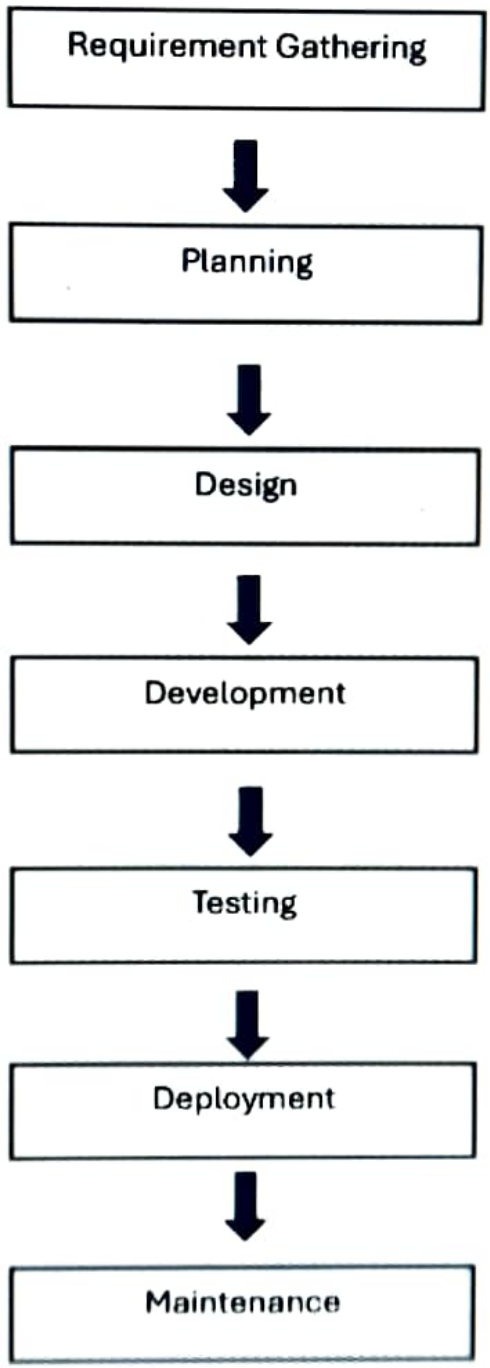
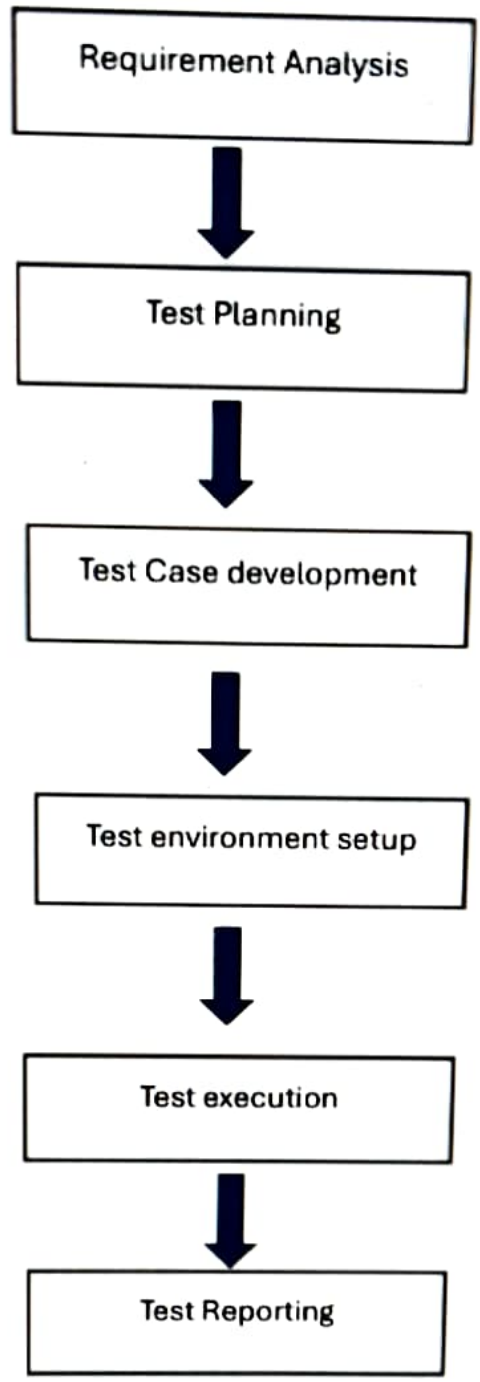
ACTIVITY I: SDLC FLOW CHART

The Software Development Life Cycle (SDLC) is a structured process used for developing software applications. It outlines the stages involved in software development, including planning, analysis, design, implementation, testing, deployment, and maintenance. The SDLC aims to produce high-quality software that meets or exceeds customer expectations while being delivered on time and within budget.



ACTIVITY - II STLC FLOW CHART

The **Software Testing Life Cycle (STLC)** is a structured process that defines the different stages of testing performed to ensure a software application meets specified requirements and is free from defects.



ACTIVITY -III

TYPES OF TESTING

FUNCTIONAL TESTING:

- Checks what the system does (features and functions)

Functional Testing is a type of testing in which the system is tested against the functional requirements and specifications. Functional testing ensures that the requirements or specifications are properly satisfied by application.

Advantages of Functional Testing:

Bug-free product: Functional testing ensures delivery of a bug-free and high-quality product

Customer satisfaction: It ensures that all requirements are met and ensures that the customer is satisfied

Testing focused on Specification: Functional testing is focused on specifications as per customer usage

Proper working of application: This ensures that the application works as expected and ensures proper working of all the functionality of the application

Types of Functional Testing:

1. **Unit Testing:**
    - Description: Tests individual components or functions of the software in isolation.
    - Purpose: To ensure that each unit of the software performs as expected.
    - Example: Testing a specific function in a code module to verify it returns the correct output for given inputs.
2. **Integration Testing**

It checks whether two or more modules work properly together. Even if each module works alone, integration testing ensures they communicate correctly.

Example:

Two modules:

- Module A (Login Page): Takes username & password
- Module B (Database): Stores and verifies user info

Integration Test → When login sends details to the database, does the system correctly show "Login Successful"?

ACTIVITY-V

BRD AND FS DOCUMENT FOR AMAZON

BUSINESS REQUIREMENT DOCUMENT:

REQ_01
When a user opens the website/app, the Home Page should appear first.

REQ _02
The Home Page should have a search box to find products.

REQ _03
The Home Page should show product categories like Electronics, Fashion, Grocery, Books, etc.

REQ _04
Users should be able to log in using email or mobile number and password.

REQ _05
New users should be able to create an account using email or mobile number.

REQ _06
Users should be able to view product details like name, price, image, description, and ratings.

REQ _07
Users should be able to add products to the shopping cart.

REQ _08
Users should be able to change the quantity or remove products from the cart.

REQ _09
Users should be able to place an order from the cart.

REQ _10
Users should be able to select an existing address or add a new delivery address.

REQ _11
Users should be able to choose payment methods such as UPI, Card, Net Banking, or Cash on Delivery.

REQ _12
After placing an order, users should get a confirmation message with an Order ID.

REQ _13
Users should be able to check their order status (Ordered → Packed → Shipped → Out for Delivery → Delivered).
