Rework: Waterfall Vs Agile – Comparison Table

Feature	Waterfall Model	Agile Model
Approach	Linear and sequential	Iterative and incremental
Process Flow	Moves step-by-step (Requirements → Design → Development → Testing → Deployment)	Continuous cycles (Plan → Develop → Test → Review → Repeat)
Flexibility	Rigid, changes are difficult once a phase is completed	Highly flexible; changes can be made anytime
Requirements	Must be clearly defined at the beginning	Can evolve throughout the project
Customer Involvement	Low; client reviews mainly at the end	High; client provides continuous feedback in every iteration
Delivery	Final product delivered after full development	Working increments delivered frequently (e.g., every Sprint)
Testing	Done after development is complete	Continuous testing within each iteration
Team Collaboration	Limited; roles are clearly defined and follow a structured hierarchy	High collaboration; cross-functional teams work together

ACTIVITY – 2

Scrum

Scrum is an Agile framework used for developing complex products through collaboration, iterative progress, and continuous improvement. It organizes work into short, time-boxed cycles called *sprints* (usually 2–4 weeks), during which a cross-functional team delivers small, usable increments of the product. Scrum includes defined roles (Product Owner, Scrum Master, Development Team), key events (Sprint Planning, Daily Scrum, Sprint Review, Sprint Retrospective), and artifacts (Product Backlog, Sprint Backlog, Increment) that help teams stay focused, respond quickly to change, and continuously improve both the product and the process.

Three Pillars of Scrum

1. **Transparency:** Everyone should clearly see the work and process.
2. **Inspection:** The team regularly checks progress and the product.
3. **Adaptation:** The team adjusts and improves based on what they learn.

Scrum Roles

1. **Product Owner:**
   Represents the customer, decides what features are important, and manages the product backlog.
2. **Scrum Master:**
   Supports the team, removes obstacles, and ensures Scrum rules are followed.
3. **Development Team:**
   Builds and delivers a working piece of software at the end of each sprint.

1. Definition of Jira

Jira is a **powerful project management, issue tracking, and workflow automation tool** developed by Atlassian.

Originally created for **bug tracking**, Jira has evolved into a full-featured platform used for **Agile project management**, supporting frameworks like **Scrum**, **Kanban**, and hybrid models.

Jira allows teams to:

- Plan projects
- Create and manage tasks
- Organize sprints
- Track progress in real-time
- Manage bugs
- Customize workflows
- Generate reports for decision-making

It is widely used across industries such as **software development, IT services, operations, finance, marketing, and HR** due to its flexibility and scalability.

2. Benefits of Jira (Expanded)

1. Centralized Workspace

Jira provides a single platform where teams can store requirements, tasks, bugs, documents, and sprint details.
This helps avoid confusion and maintains all project information in one place.

2. Strong Agile Support

Jira is preferred by Agile teams because it includes:

- Scrum boards

Impact Matrix

Severity / Priority	High Priority	Medium Priority	Low Priority
High Severity	1. Application crash on checkout 2. Payment gateway not loading 3. Login page not opening 4. Add-to-Cart button not working for all products 5. Entire category page failing to load	1. Login button not clickable intermittently 2. Registration page not submitting 3. PDP not loading images 4. Search returning no results for valid keywords 5. "Place Order" button disabled	1. Rare crash while navigating to Wishlist 2. Slow loading of homepage banner 3. Intermittent "Page not found" error in footer links 4. Occasional freeze on product comparison 5. Rare timeout during Contact Us submission
Medium Severity	1. Sorting giving wrong results (e.g., Price Low-High incorrect) 2. Wrong total calculation in cart 3. Gift card code not applied 4. Product reviews not saving 5. Incorrect tax calculation	1. Validation messages not showing properly 2. Incorrect filters applied in advanced search 3. Incorrect stock message shown 4. Pagination skipping items 5. Wishlist count not updating	1. Incorrect product tag display 2. Minor alignment shift in review section 3. Incorrect discount display style 4. Tooltip not appearing on search box 5. Slow dropdown opening
Low Severity	1. Logo pixelated on mobile view 2. Currency symbol mismatch on PDP 3. Minor spelling error in UI labels 4. Font inconsistency in cart totals 5. Minor shift in header alignment	1. Placeholder text mismatch in registration fields 2. Extra white space on footer 3. Old product images still shown in gallery 4. Partial misalignment in product rating stars 5. Pagination arrows offset slightly	1. Cosmetic UI issues (small font difference) 2. Color shade mismatch in buttons 3. Minor padding inconsistency in dropdowns 4. Border thickness mismatch in forms 5. Button hover color slightly off
